Call for care

Dementia Monitor

Today wandering is a common problem in people with dementia. The CareTech dementia monitor is designed and built to work alone or plug into the CareTech 5000 system.

Alerting staff that the patient has potentially taken themselves out of their environment and into a situation.

CareTech dementia monitor eliminates much of the stress-and much of the heavy expense of minute by minute close observation of Alzheimer's victims and those with special needs. Because it allows those under supervision a greater degree of freedom, it fosters independence and self-sufficiency. Families, Aged Care facilities, and institutions who offer this level of care will notice that CareTech dementia monitor improves the quality of life for those they are responsible for while allowing for a more normal care environment.

The CareTech dementia monitor can be connected to the Gustav tracking beacon and the patient wears an alarm pendant hidden inside the pendant is an RFID device which will automatically send a location at a preset time.

Night shift with Dementia Patients can be made easier with a Gustav at the end of each corridor as soon as a patient comes within a certain distance a text message is sent via the nurse call system to the night staff, they can immediately start to find the patient and return them to their room.

Being wall mounted will allow Aged Care staff easy access to program the device.
